1. Introduction

The rapid growth of digital platforms has significantly transformed recruitment processes worldwide. In Nepal, however, job seekers and employers still face challenges such as limited filtering options, poor usability, and inefficient communication in existing job portals. These limitations often result in mismatched job applications, increased hiring time, and user frustration.

While a number of online job portals are available in the Nepali market, many job seekers and employers still depend on informal methods such as social media postings, word-of-mouth communication, and personal networks. Existing digital platforms often present issues including unclear navigation, limited search and filtering capabilities, poorly structured interfaces, and inefficient application management. These limitations can lead to confusion, reduced trust in the system, and longer recruitment cycles, ultimately affecting both job seekers and organisations.

Workify is a web-based job finder application designed to respond to these challenges through a strong focus on user experience and usability. The platform aims to create a structured and intuitive environment where job seekers can search, filter, and apply for suitable job opportunities with ease, while employers can post vacancies and review applications in an organised and efficient manner. By prioritising clarity, simplicity, and accessibility, Workify seeks to reduce user effort and improve engagement across the recruitment process.

The objective of this project is to apply User Experience (UX) design principles acquired during the User Experience Design module to a practical, real-world problem within the digital recruitment domain. A User-Centred Design (UCD) approach was adopted throughout the development process, starting from requirement gathering and user research, followed by low-fidelity wireframes, high-fidelity interface design, and usability evaluation. Design decisions were driven by user needs, established UX theories, and usability heuristics rather than purely technical considerations.

This document outlines the complete UX design process undertaken for the Workify web application. It demonstrates how research-based decision making, iterative design, and usability testing were used to shape the interface and interaction flows. The documentation also reflects on the effectiveness of the final design in addressing user needs and highlights the importance of UX design in developing accessible, efficient, and user-friendly digital recruitment systems.

2. Literature Review and Background of the System

Online job portals such as MeroJob, KumariJob, and Growthsellers have contributed to the digitisation of recruitment in Nepal. While these platforms provide basic job listing and application features, research indicates that many suffer from outdated interfaces, limited personalisation, and poor user engagement.

Studies on digital recruitment systems highlight that usability and clarity play a critical role in user retention and task completion. Complex navigation, information overload, and lack of real-time feedback often discourage users from continued use. Additionally, many platforms fail to support efficient resume management and employer–applicant interaction.

From a UX perspective, effective job portals should minimise cognitive load, support efficient searching, and provide clear feedback during application processes. These findings informed the design direction of Workify, focusing on simplicity, accessibility, and user control.

3. How Workify Improves Existing Job Portals

Workify addresses the limitations of existing job portals by prioritising usability and structured interaction. Unlike many platforms that rely on cluttered dashboards and dense job listings, Workify presents information in a clean and organised layout.

Advanced filtering options allow users to search jobs by location, skills, job type, and experience level. Employers benefit from structured job posting forms and clear applicant management interfaces. The platform avoids unnecessary complexity by focusing on essential recruitment tasks, thereby improving efficiency and user satisfaction.

4. PACT Analysis

5. Requirement Analysis

Requirements were gathered through informal interviews, peer discussions, and analysis of existing job portals. Participants included students, job seekers, and small business owners.

Techniques such as questionnaires, task analysis, and comparative analysis were used to identify usability gaps and functional requirements. This process ensured that system features addressed real user needs rather than assumptions.

6. Business Process Improvement (BPI)

Workify follows a Business Process Improvement approach rather than Business Process Reengineering. Existing recruitment workflows were refined by reducing unnecessary steps and improving task efficiency without altering familiar user behaviours.

7. User Stories

- As a job seeker, I want to filter jobs by skill and location so that I can find relevant opportunities quickly.
- As an employer, I want to manage applications efficiently so that I can identify suitable candidates.
- As an admin, I want to monitor platform activity to ensure system integrity.

8. Low-Fidelity Design

Low-fidelity wireframes were created to explore layout structure and navigation flow. These designs focused on dashboard organisation, job listings, and application forms without visual styling.

9. Wizard of Oz Technique

The Wizard of Oz technique was used to simulate personalised job recommendations. Users interacted with the interface as if recommendations were automated, while results were manually prepared. This helped evaluate user expectations without complex backend implementation.

10. High-Fidelity Design

High-fidelity prototypes were designed using Figma to represent the final interface. Consistent typography, spacing, and colour schemes were applied to ensure clarity and visual hierarchy.

11. User Flow Diagrams

User flow diagrams illustrate key paths for job seekers and employers, including registration, job search, application submission, and applicant review.

12. Guerilla Testing

Guerilla testing was conducted with peers unfamiliar with the system. Participants completed tasks such as job search and application submission. Observations focused on navigation clarity and task completion.

13. Improvements for Final Product

Based on testing feedback, navigation labels were clarified, button placement was standardised, and feedback messages were improved to enhance usability.

14. Nielsen's Heuristic Evaluation

Nielsen's heuristics were applied to evaluate usability, focusing on visibility of system status, consistency, user control, and error prevention.

15. User Interface Diagram (UID)

The UID illustrates the relationship between authentication screens, dashboards, job listings, and administrative features, ensuring logical navigation.

16. Design and Development Methodology

An iterative User-Centred Design methodology was followed, integrating design and development with continuous feedback loops.

17. Design Principles

Key principles included simplicity, consistency, accessibility, and immediate feedback. These principles reduced cognitive load and improved task efficiency.

18. Testing

Task-based testing and informal usability evaluations ensured the system met user expectations and functional requirements.

19. Conclusion

Workify demonstrates the practical application of UX principles in addressing recruitment challenges in Nepal. By focusing on usability, accessibility, and efficiency, the platform delivers a user-friendly job finder web application aligned with academic UX standards.
